

Building the Data Foundation for Reliable RSI with Real-World Usage Feedback (Interaction Traces, ...)

1. Data Collection (from Internal Collaboration)

Heterogeneous Data continuously produced in real work

2. Data Organization

Extract entities, events, relations to build a time-driven context graph

3. Quality Evaluation

Automated evaluation (absolute + GSB); Identify and attribute errors

4. Feedback Construction

Corrected data and standards loop back; usage traces add evidence; human-gated.

5. Agent Improvement in Real Work

Better task performance and user experience within products.

Better Data and evaluation for next iteration
